

# Unit 3 Key vocabulary

- Adaptations =
- Any trait or behavior that helps an organism survive or reproduce

# Natural Selection

- best adapted to the environment survive and reproduce

Natural selection → biodiversity

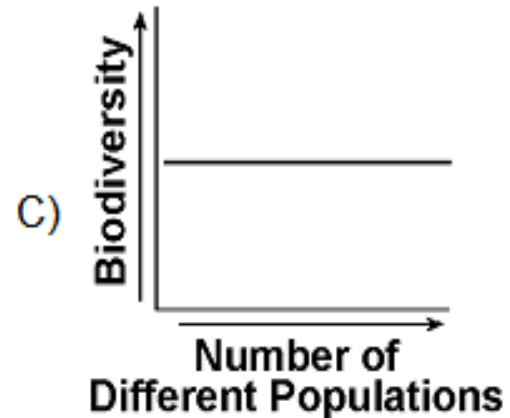

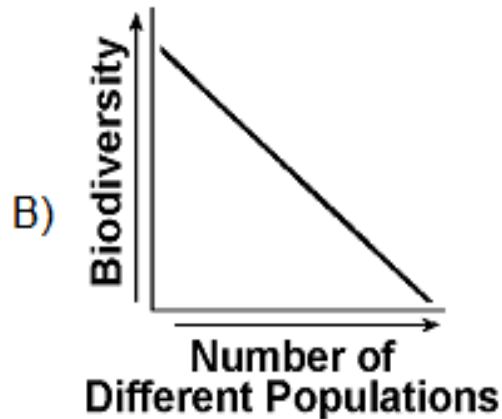

# Define biodiversity

- Variety of life
- Variety of genetic material (DNA)
- more biodiversity = more stability

What is the relationship between biodiversity and number of different populations?

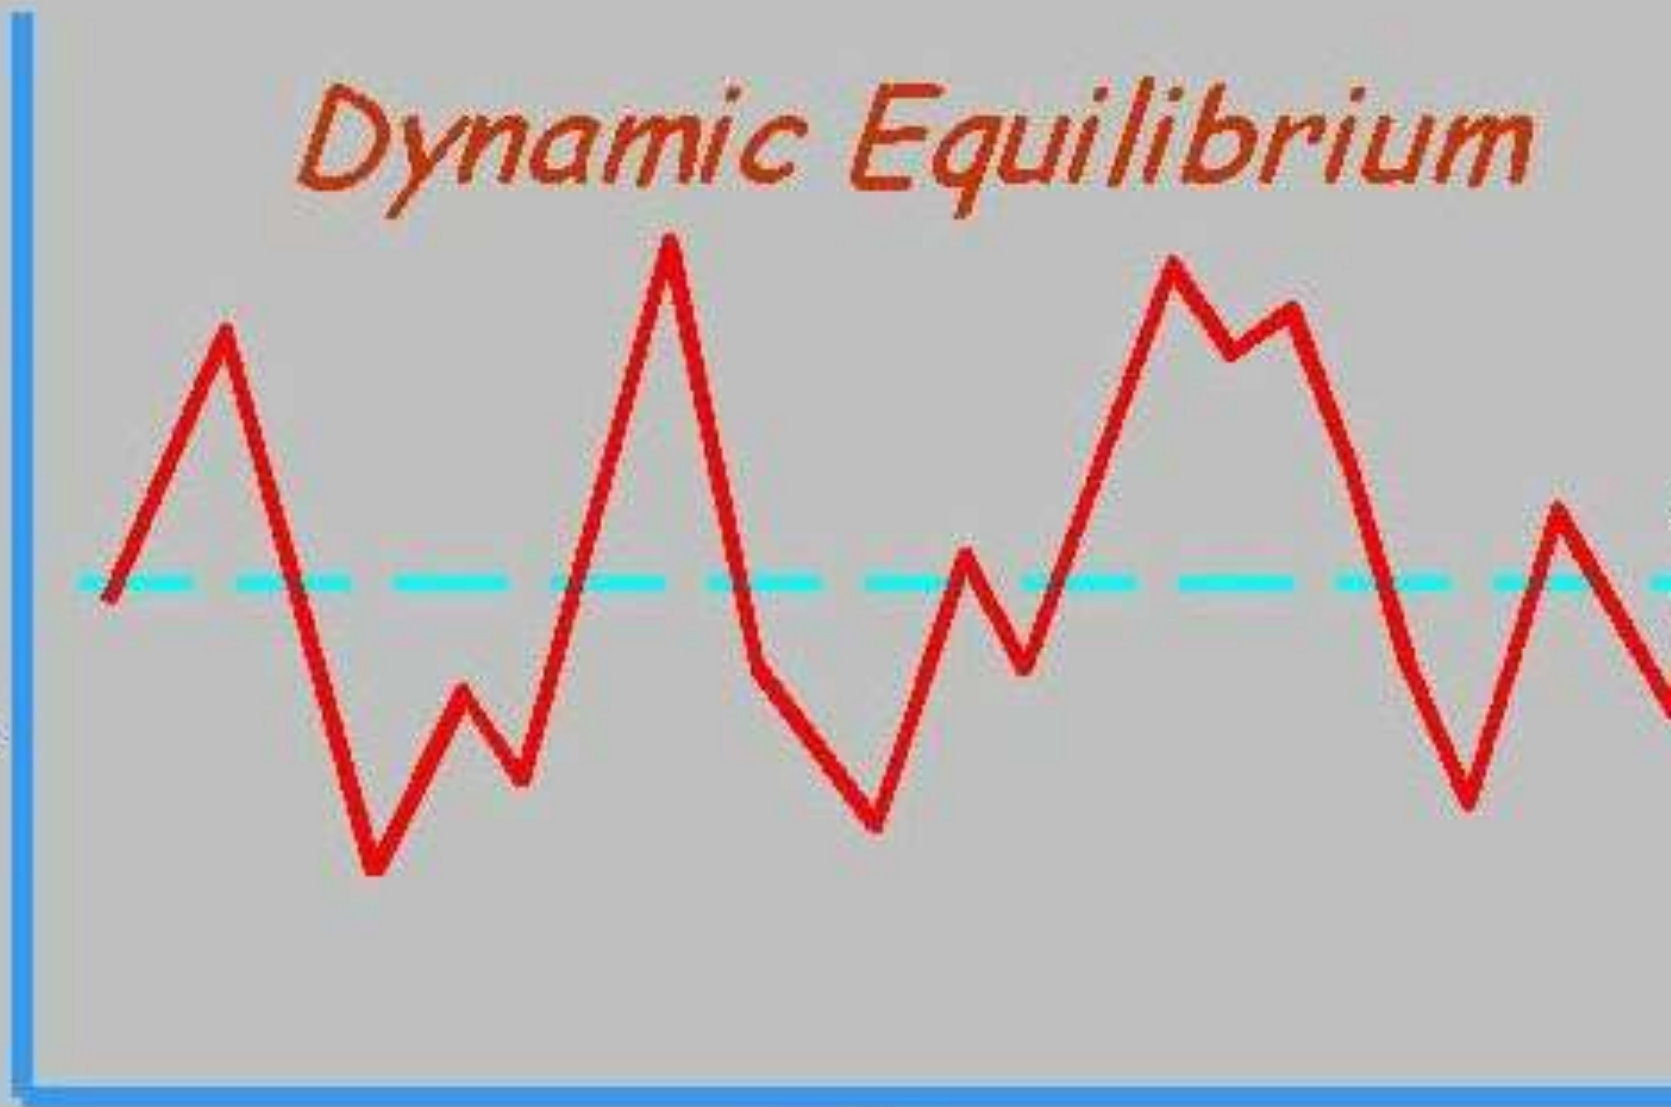

# Unit 3 Key ideas

- Biotic and abiotic factors interact → dynamic equilibrium

# *Dynamic Equilibrium*

System

Time

- Human decisions and activities often disrupt dynamic equilibrium

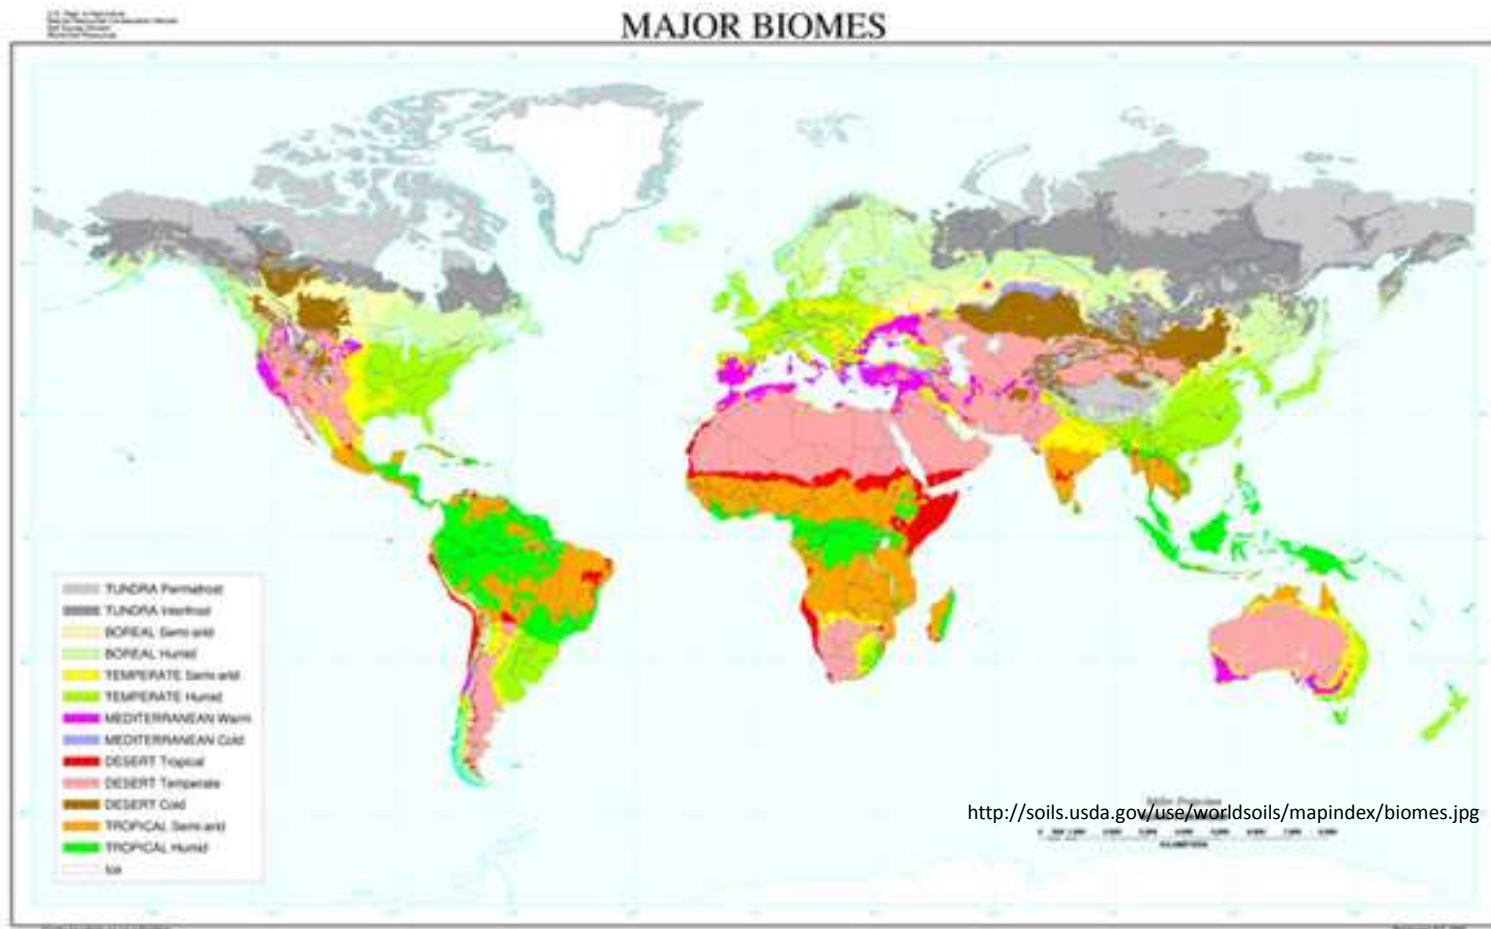

# What has happened to the dynamic equilibrium of atmospheric carbon?

# Biomes = Large geographic areas having similar ecosystems

Ex: desert, tundra, grasslands, tropical rainforests...

List physical characteristics → the type of biome (community) in an area

- Temperature
- Latitude
- Precipitation
- Altitude

# Land Biomes

Deserts: 0-25 cm precipitation / yr

[Desert adaptations](#)

# Desert adaptations

- Plants and Animals adapted to
  - Little water
  - Cold nights and hot days

# Humans impact deserts

Overgrazing  
and climate  
change →  
desertification

# Desertification = useful land converted to deserts

- Human activities → increasing size and number of deserts

**Extra heat evaporates water from the ocean and pulls  
moisture even more quickly from the soil**

A man with a mustache, wearing a white thobe and a red and white checkered ghutra, stands in a desert camp. He is looking off to the side. Behind him is a large, simple tent made of brown fabric, with some items hanging from a line. The ground is sandy and the sky is a pale, hazy color.

**“I had 400 acres of wheat,  
and now it’s all desert.”**

- **Ahmed Abdullah, Syrian  
farmer**

October 2010

# Causes of desertification

- Burning fossil fuels → Climate change
- Overgrazing = too many farm animals eat too much plant material

A wide, flat grassland landscape with rolling hills in the background under a cloudy sky. The foreground is a vast expanse of green and brown grasses. The hills in the distance are covered in similar vegetation, with some rocky outcrops visible. The sky is overcast with grey clouds.

# Grasslands

- **Climate: (25-100cm precipitation/yr.)**
- **Enough water → grasses but long droughts and fires prevent trees**

Maintained by fire

# Seasonal droughts

# Herbivores

[American Prairie](#)

More than 90% of US prairies have been lost →  
agriculture →

# Nebraska

# Why is this a problem?

- Loss of biodiversity = loss of stability

**Monoculture**  
(Unstable Simple Community)

**Biodiversity**  
(Stable Complex Community)

# Ohio

# Oklahoma and Texas

**Overgrazing → desertification and**

Removal of native grasses →  
increased erosion and loss of topsoil

- List 2 reasons why the dust bowl happened
- Name 2 ways to prevent a dust bowl

# US Dust Bowl of the 1930's

Solutions = plant cover crops

# Plant wind breaks (shrub borders)

# Tundra

- Found at high latitudes and high altitudes

High altitude → alpine tundra

DROP OFF  
JTC  
SNOW  
BOARDING

Permafrost = permanently frozen  
ground

Climate change → melting permafrost  
→ poor drainage → boggy conditions

Boggy  
conditions  
→ methane

# Guiding question for slideshow

- Life in the tundra is challenging
- How have Inuit peoples of the Canadian arctic managed to survive for generations

# Meet Elijah Tigullaraq

And His wife Naomi

They live in Pond Inlet in  
the Canadian province of  
Nunavut

TUVAO

WOODWARD GROUP

# Tundra Communities

- Autotrophs = Only low lying plants
  - Lichen (mutualistic relationship between a fungus and an algae) are a favorite food of caribou
- Animal kingdom adaptations = often migrate or hibernate underground during the winter
- Lots of insects in summer due to boggy conditions

# Human Impacts on tundra

- Development and overuse → long lasting effects because the tundra has very slow rates of decomposition and nutrient cycling

Ex: Injury from oil drilling

# Hiking can destroy alpine tundra

- Global warming → melting permafrost → Releases methane gas → increased global warming (positive feedback mechanism)

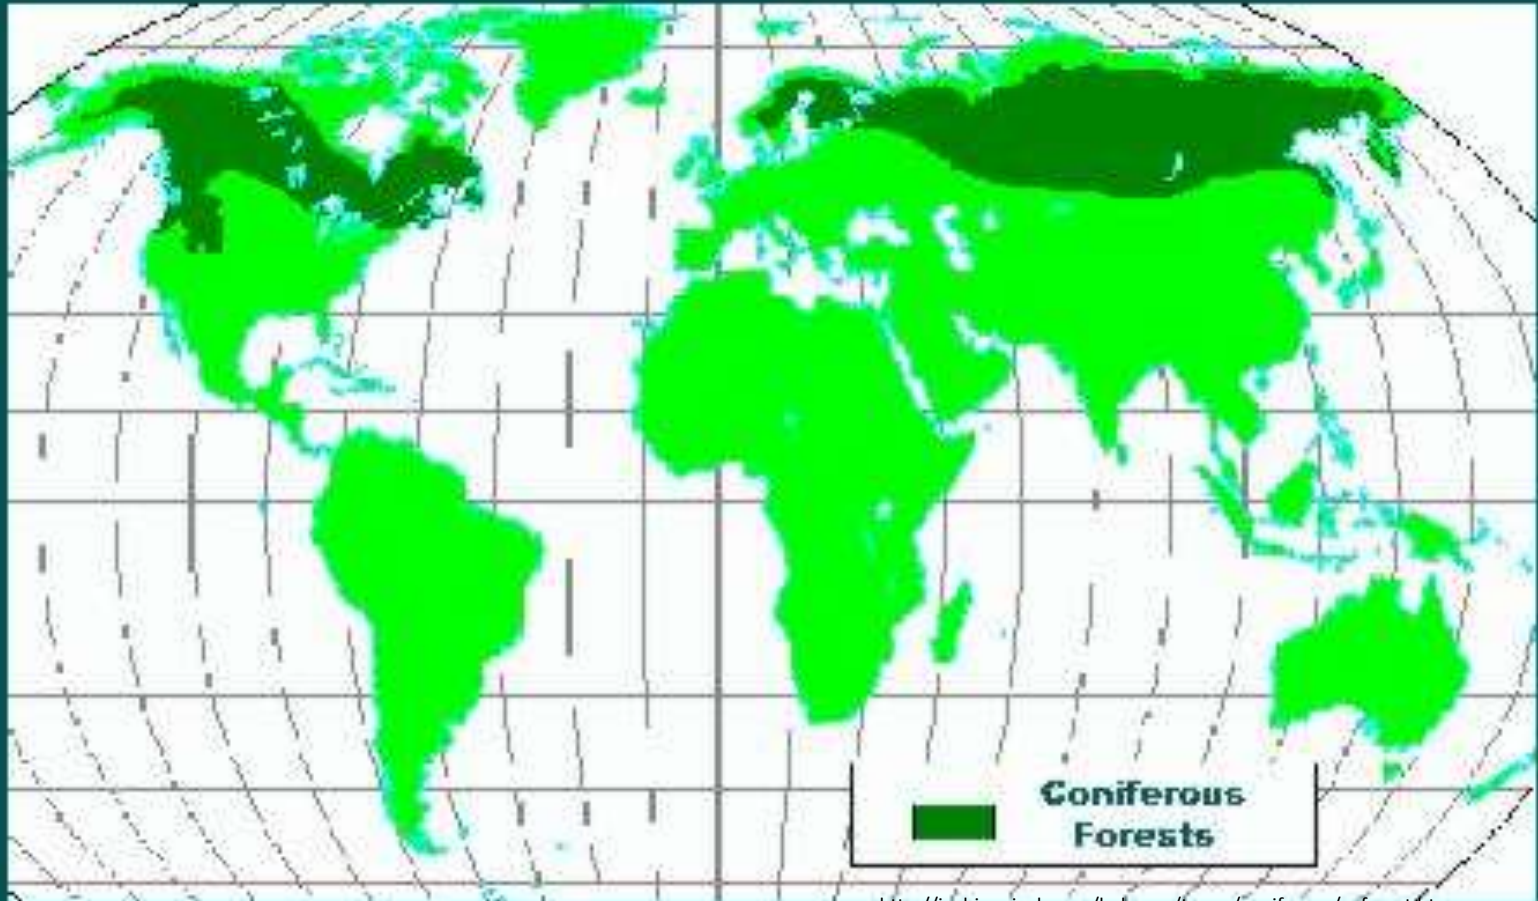

# Coniferous forests

- Also called taiga or boreal forests
- Plants: Fir, spruce, pine, larch, and other short growing trees and shrubs
- Animals/Fauna:
  - Large herbivores (moose, elk),
  - small herbivores (snowshoe hare, squirrels),
  - predators (wolves, foxes, bears, lynx, weasels, owls),
  - many insects and birds in the summer

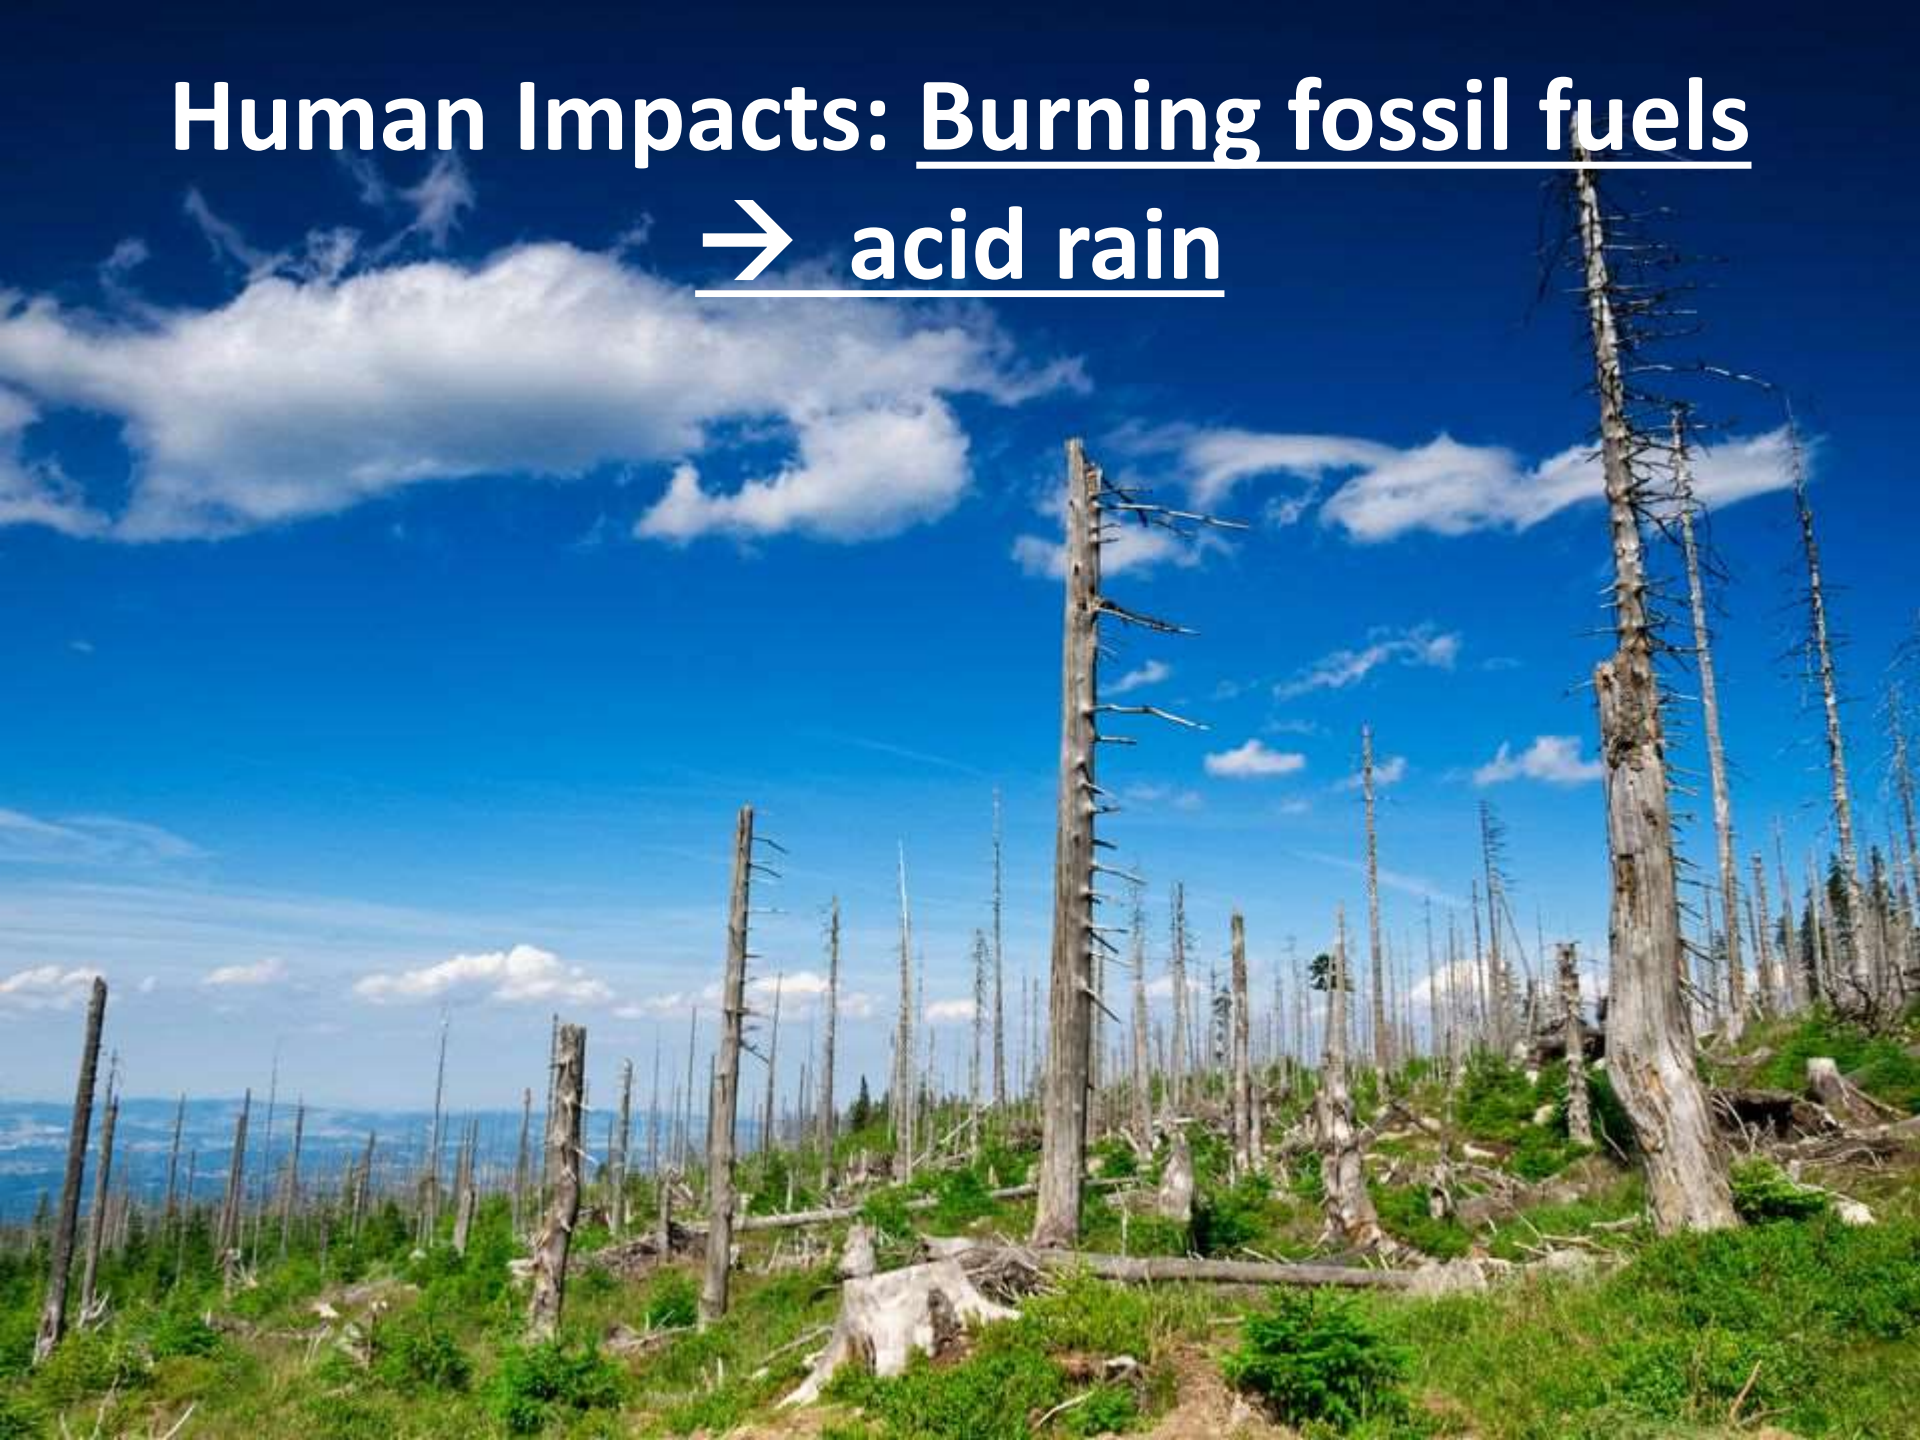

# Largest land biome

[http://inchinapinch.com/hab\\_pgs/terres/coniferous/c\\_forest.htm](http://inchinapinch.com/hab_pgs/terres/coniferous/c_forest.htm)

# Human Impacts: Burning fossil fuels → acid rain

Feb. 1922

**Deforestation → loss of habitat and  
climate change**

# Deciduous Forests

- Plants: Broad leafed plants (maple, beech, birch, oak...)
- Animals: adapted to seasons (hibernation, migration)
- Human Impact: acid rain, logging, most carnivores eliminated by over-hunting

# Deciduous trees play a major role in the water cycle

water loss from plants = \_\_\_\_\_

# Beak adaptations

# Temperate rainforests of the world

# Temperate Rainforests (NW coast)

- Plants:
  - Pine, spruce, fir, vines, mosses, lichen, ferns
- Animals:
  - Herbivores: squirrels, mule deer, elk,
  - Predators: bear and eagle

# Human Impacts

Logging → habitat loss and extinctions

**Canadian  
forests**

**Jizera mountain  
in  
Poland**

Burning fossil fuels (esp. coal) →  
acid rain

# Acidity Effects on Baby Trout

Abnormal

pH 5.0

Normal

H. Howard, "Acid Rain" 1988, p. 72

pH 5.5

pH 4.6

H. Howard, "Acid Rain" 1988, p. 72

# Example of a temperate forest = Tongass National Forest

- 17 million acres
- World's largest temperate rain forest
  - Resource use vs. conservation

# USDA Forest service tries to balance resource use with conservation

# Northeastern's School for Field Studies 1989

# Why were eagles extinct in the lower 48 states in the 1980s

# Pesticides like DDT

STANDARD

STOCK  
SPRAY

METHOXYCHLOR  
(BOVINOL)

able Flies, Horn Flies, House Flies, Mosquitoes

ACTIVE INGREDIENTS  
(by weight)

FLY BAIT  
(SUGAR BAIT)  
U.S.D.A. REG. NO. 57

CONTAINS DDVP  
Use as Dry Bait or Spray

Active Ingredients:  
2,5-Dichlorobenzyl dimethyl phosphorothioate  
Published ingredients:  
phosphorothioate  
Inert Ingredients

CAUTION: KEEP OUT OF REACH  
SEE OTHER WARNINGS ON  
LABEL

RALSTON PURINA CO.  
GENERAL OFFICES - CHICAGO, ILL.  
ST. LOUIS, MO.

CONTAINS  
CYTHION

PURINA  
MALATHION SPRAY

FOR INSECT CONTROL: FARM BUILDINGS-  
POULTRY-LIVESTOCK-PETS-GARDENS

Active Ingredients:  
-malathion  
Xylene  
Inert Ingredients:  
-0,0-dimethyl dithiophosphate of methyl mercaptan

ARSENATE

ACME

# Problem = Biological Magnification

Some pollutants build up as they move up the food chain

# Ex: DDT = pesticide that kills insects

- Sprayed to kill mosquitoes
- Mosquito consumers get lots of DDT

**MURDER Flying Pests**

Use "Push-Button" **BLACK FLAG** Bomb

*Just press the Button...*

**BUGS DROP DEAD!**

**BLACK FLAG**  
PUSH BUTTON  
**Aerosol INSECT KILLER**  
12 ounce  
Season's

**FAST KNOCKDOWN!** Black Flag works fast—kills flies, mosquitoes, moths, gnats, wasps and other irritating flying pests.

**4 TO 8 SECONDS SPRAYING** clears average room of flying insects. Easy to aim into corners, around light fixtures.

**NO spray gun to buy...**

**NO dripping...**

**NO staining of walls, floors, curtains, draperies.**

**IT'S HERE!**... The handiest, easiest-to-use insect killer you've ever seen... at a price anyone can afford! It's the new Black Flag Aerosol Insect Killer containing DDT. Just a touch of your finger on the handy push button releases a potent, quick-acting mist that brings sure, sudden death to flies, mosquitoes, flying moths, gnats and other insect pests.

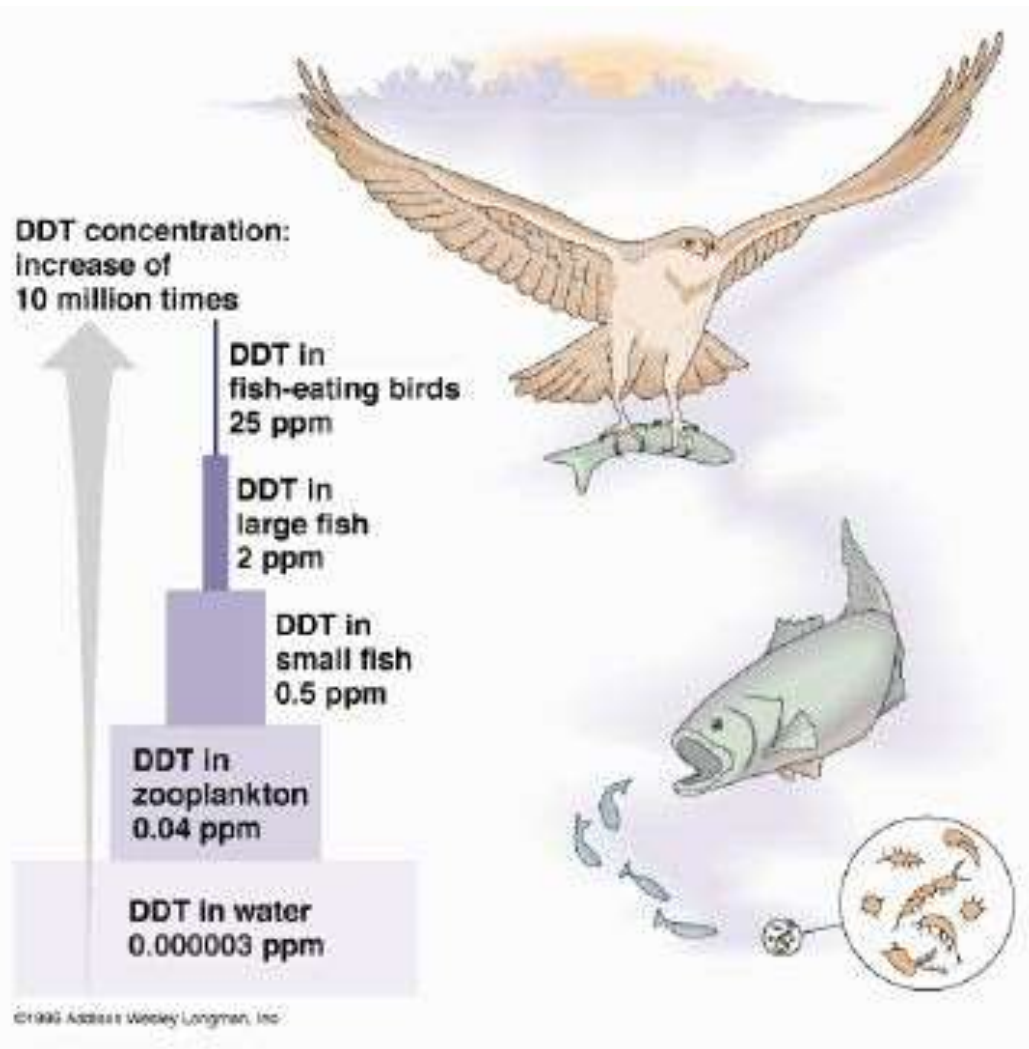

Top predators consume  
concentrated amounts of toxins

Bald eagles almost went extinct

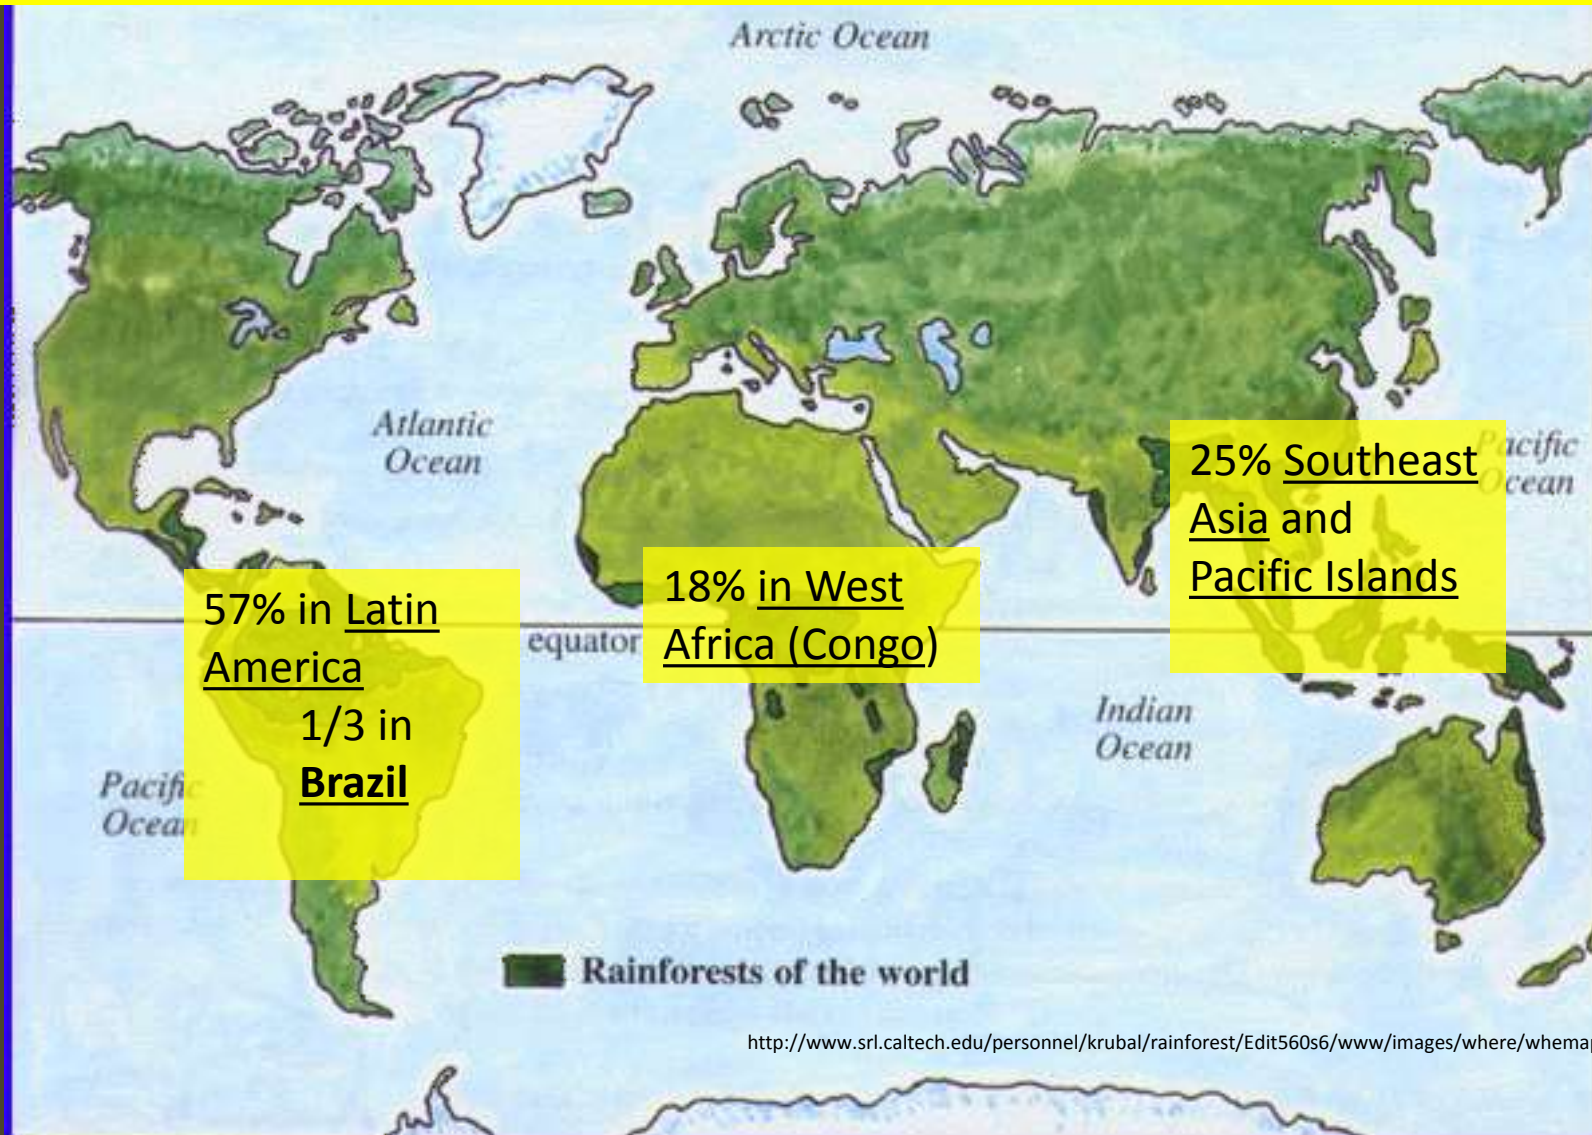

# Title: Biological magnification

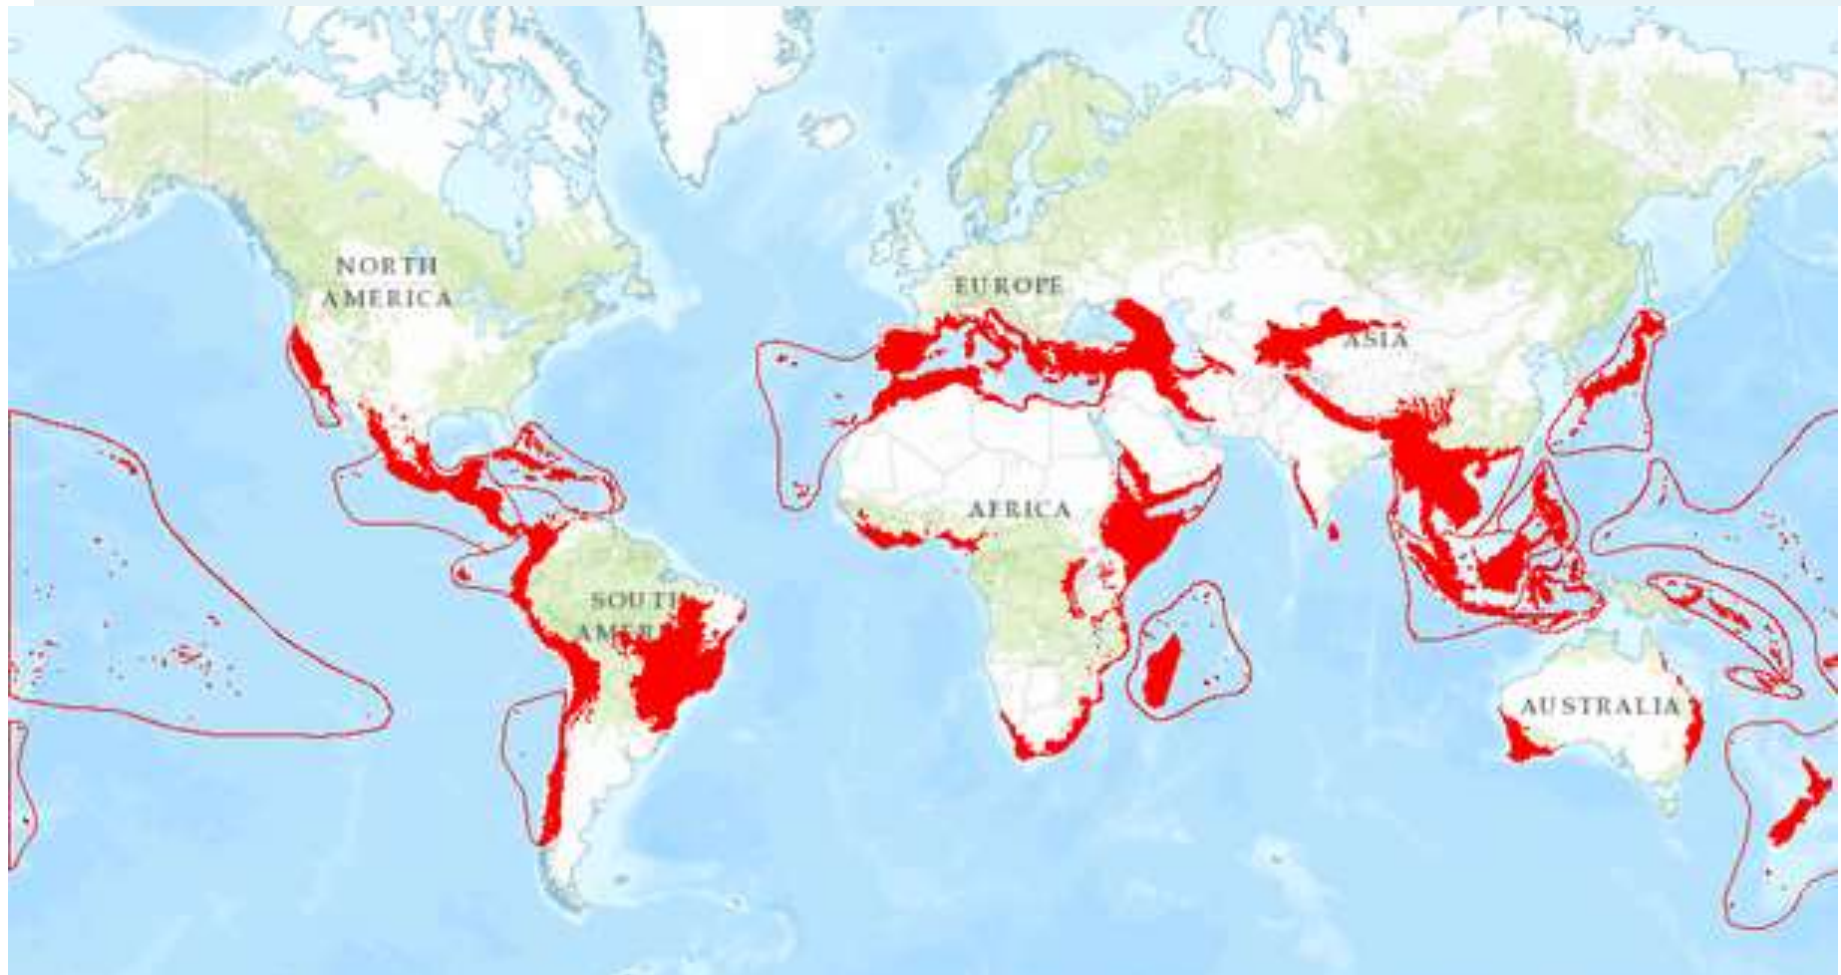

**READ ARTICLE IN NOTES ABOUT HOW  
BALD EAGLES WERE SAVED  
AND ANSWER QUESTIONS**

# Tropical rainforests of the world

- **Biodiversity** = lots of different species

Tropical rainforests = Biodiversity Hotspots

# Human Impacts

- Deforestation and over-harvesting →
  - Most exploited and endangered biome
- Rainforests are cleared for agriculture, logging, and mining →
  - loss of topsoil and depletion of soil nutrients
- Many organisms that live in rainforests are headed towards extinction

- Clear cutting → increased erosion →
- water pollution and kills organisms in rivers and streams

# Why we should care about extinction rates

- Diversity → stability
  - Remove one species affect many
- Diversity → resources
  - Ex: different species → medicines, food, building materials...

# Human causes → loss of biodiversity

## 1. Habitat destruction

### – Examples

- black rhino,
- African and Asian elephants

*Watch planet in peril video clip:  
searching for black sifaka*

Indian Tiger

Black Rhino

African Elephant

Asian or Indian Elephant

# Humans → loss of biodiversity

2. Direct harvest or exploitation
  - Example
    - Mountain gorillas shot for bushmeat and trophies
    - Overfishing → loss of many fish species
  - *Watch planet in peril clip: victims of the black market*

<http://www.zsl.org/zsl-london-zoo/news/shocking-images-of-mountains-gorilla-family-shot-dead,377,NS.html>

### 3) Introduction of non-native invasive species

- Non-natives often have no natural predators
- Often reproduce faster or earlier than native species
- Compete with natives → native species to decline

*Watch “Protecting the Adirondacks from Invasive Species”*

# Non-native invasive species

Purple loosestrife

Eurasian water  
milfoil

Zebra mussels

Phragmites

Gypsy moths

Asian longhorn beetles

# Emerald Ashborer

# Example: Brown Tree Snake

accidentally introduced to Guam → decimated native  
bird species

Picture taken by Michael Murphey  
In Costa Rica

## 4) Pollution

A) ex: burning fossil fuels →

# Sulfur and nitrogen oxides → acid rain

## Affects water and forest ecosystems

Particulate matter → smog →  
decreased photosynthesis and respiratory problems

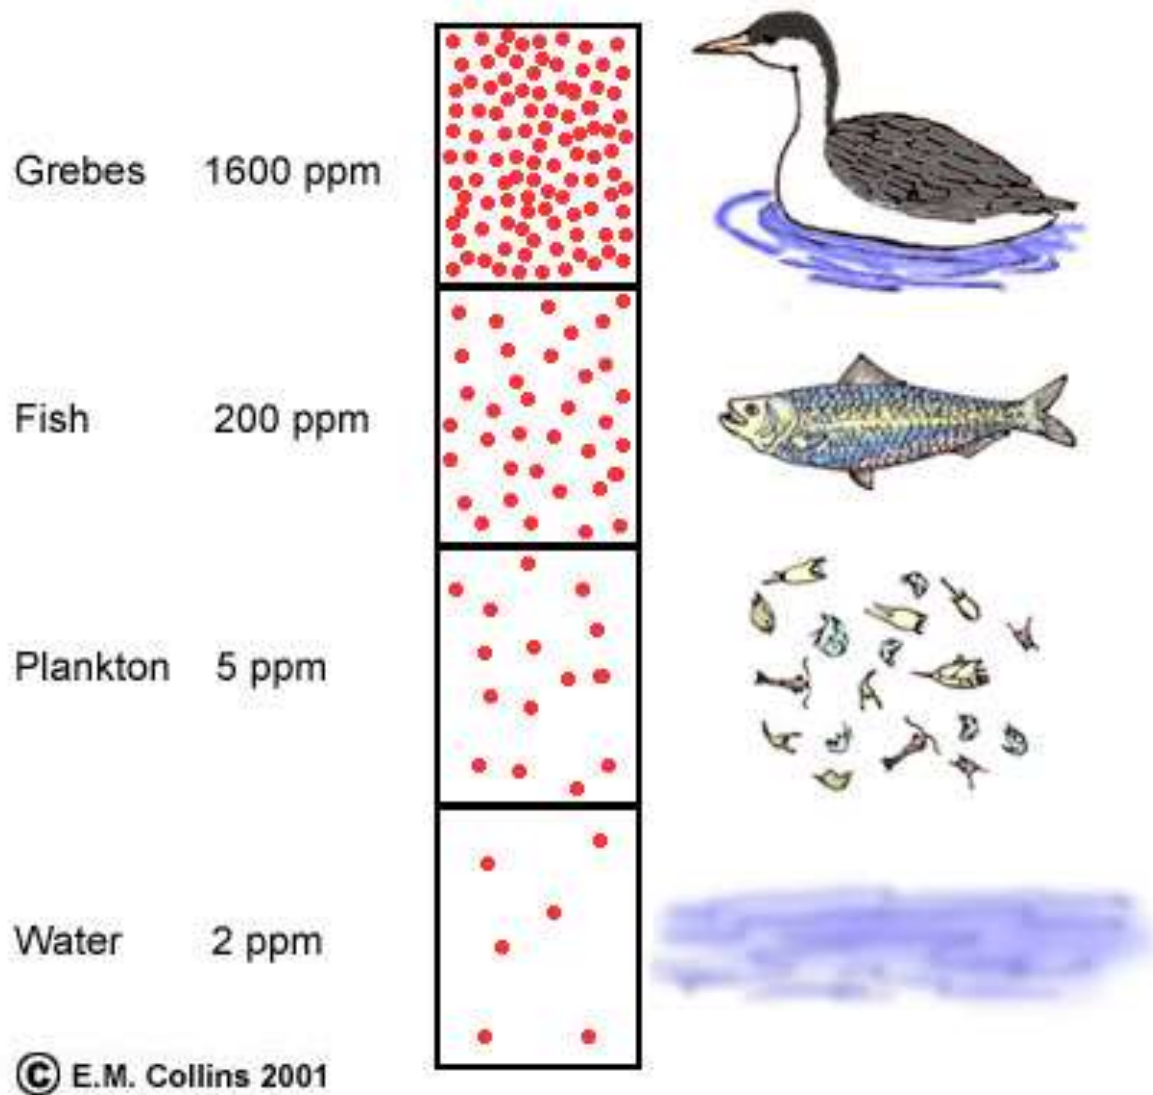

$\text{CO}_2$  = greenhouse gas → global climate changes →

- Changing weather patterns and rising sea levels → changes habitats

# B) ex: Biological magnification of toxins

## Part II. Aquatic biomes

# Aquatic biomes

- Affected by salt, pressure, light, nutrients, pH
- Light and nutrients = limit algae growth
- 71% earths surface = water
  - 3% is freshwater (less than 1% salts / vol. of water)

# Human Impacts on lakes and rivers

# Aging of lakes (Eutrophication)

- Runoff water → adds nutrients to lake = eutrophication

- Human activities increase the rate of eutrophication
  - Ex: fertilizer runoff and sewage contamination
  - Inc. nutrients → increased algae →
  - Algae run out of sunlight → die
  - increased decomposition → dec. oxygen

# Human impacts

- Overfishing → major cause of declines in worldwide fish populations recently
- <https://www.natureworkseverywhere.org/resources/fishing-for-a-future/>
- Loss of biodiversity = loss of stability in aquatic ecosystems

Define Ecological Succession

**One year later**

**10 years later**

**One hundred years later**

# Ecological succession

- Succession = Change in an ecosystem after a disturbance over time
- One biotic community gradually → another
- Pioneer communities → climax communities

# Pioneer organisms

- First to establish after a disturbance

**Lichen on a rock**  
**(lichen = algae and fungi = mutualism)**

I'm really lichen you!

# Grasses on a sand dune

# Climax Community = stable community

## Climax Communities

# Climax communities

- Climax community = Stable
- Type of climax is determined by climate
  - Latitude, precipitation, and altitude
  - Ex: Coniferous forest in Taiga regions
- Will remain until a disturbance occurs

# Until there is a disturbance

- Can be natural
  - Flood
  - Fire
  - Volcanic eruption
- Or manmade
  - Abandoned farm
  - Pollution

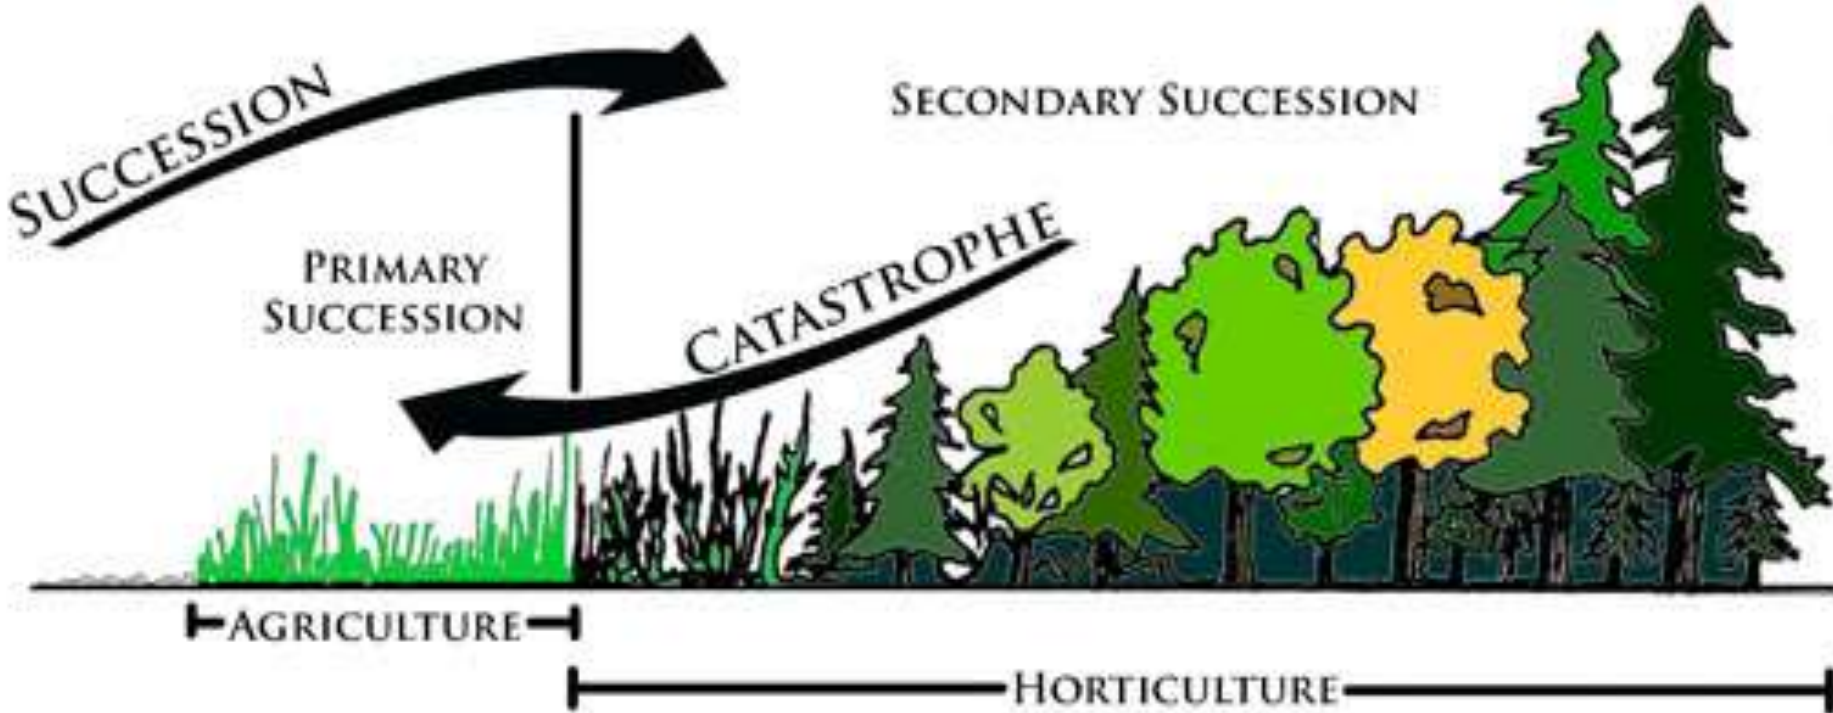

# Primary Succession

# ECOLOGICAL SUCCESSION

## SUBSISTANCE STRATEGIES

# Runoff and eutrophication → Aquatic succession
